■ Shorted Emitter Design

RCA T2300-, T2302-, T2310-, and T2312-series triacs are gate-controlled full-wave ac silicon switches. They are designed to switch from a blocking state to a conducting state for either polarity of applied voltage with positive or negative gate triggering.

The T2302 series has higher dv/dt capability and higher gate trigger current requirements than the T2300 series. The gate sensitivity of these triacs permits the use of economical transistorized and IC control circuits and enhances their use in low-power phase control and load-switching applications.

The T2300 series has rms on-state current ratings of 2.5 amperes at a case temperature of +60°C while the T2302 series has the same ratings at a case temperature of +70°C.

The repetitive peak off-state voltage rating for T2300A and T2302A is 100 volts; for T2300B and T2302B, 200 volts; and for T2300D and T2302D, 400 volts.

The T2310 and T2312 series are the same as the T2300 and T2302 series, respectively, but have factory-attached heat-radiators and are intended for printed-circuit-board applications.

NOTE: For incandescent lamp loads which produce burnout current surges with I^2t values greater than 2.5 ampere² seconds, connect a 10-ohm resistor of appropriate wattage rating in series with the load. The appropriate wattage rating can be determined as follows:

$$\text{Wattage Rating of 10-ohm Resistor} = 10 \times (\text{rms load current})^2$$
